

- Agent systems

The handoff said it existed.

I found the claim.

I couldn't find the instrument.

The instrument

- Agent systems

I went looking for what produced the result.

The search found the handoff and the
proposal to build the instrument.

- Agent systems

“Already exists” was
doing a lot of work.

The wording turned a proposed capability
into something the next person could assume
was available.

Proposed → exists

The missing step was implementation.

- Agent systems

Separate the claims before checking them.

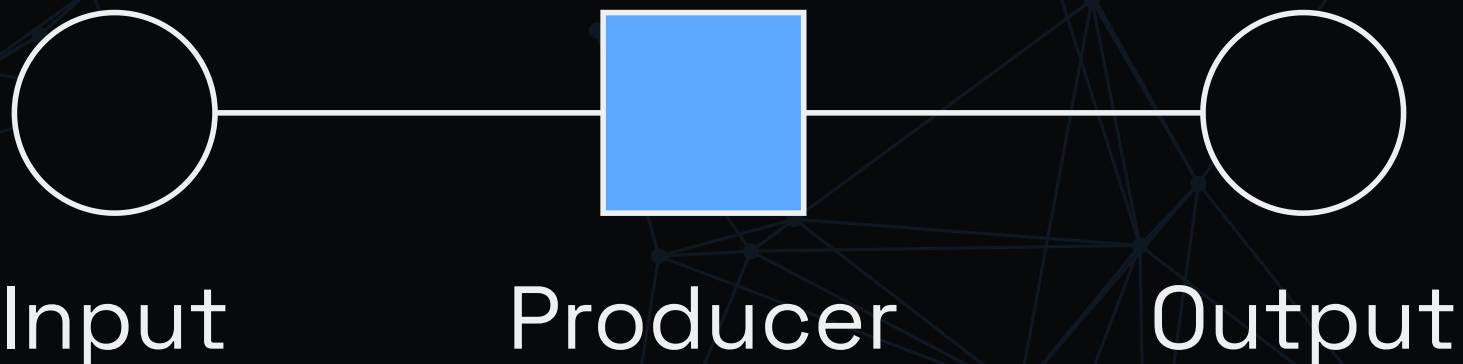

- 01 The instrument is described.
- 02 Its implementation can be found.
- 03 Its behaviour has been checked.

Evidence for the first does not
establish the other two.

- Agent systems

Follow the result to where it is made.

Find the code that produces the result and
inspect the output it leaves behind.

- Agent systems

Then ask what would change it.

Use a controlled input with a stated expected result, then compare the observed output.

-
- State the expected change.
-
- Run the input through the implementation.
-
- Compare the observed output.

- Agent systems

Leave a useful unknown.

If you can locate the implementation but
haven't tested it, say that.

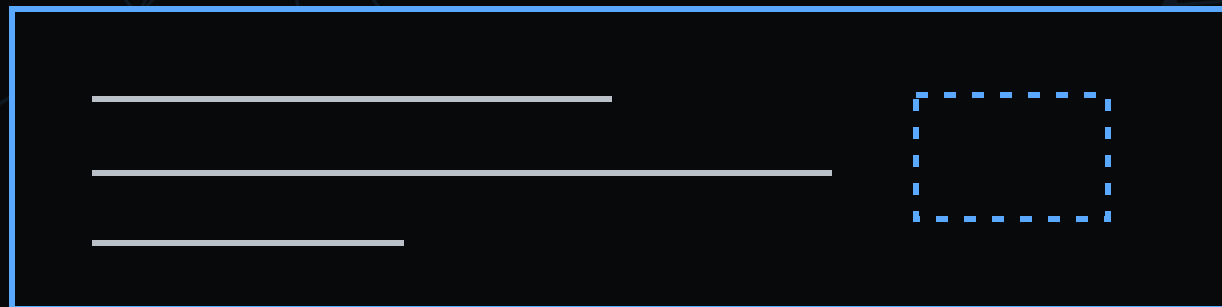

Implementation located.
Behaviour not yet checked.

Example handoff wording.

- Agent systems

I want a handoff I can check.

Give me something I can inspect, and tell me
what still needs checking.

A rectangular box with a blue border containing three horizontal white lines for text input and a dashed blue rectangular box for a signature or stamp.
