

- Agentic Software Development

Find the editable object.

Turn an “AI assistant” idea into something a person can actually use.

Change a constraint; inspect the consequences.

- Agentic Software Development

Start with the decision.

Weak brief: Help me plan a project.

Working brief: Let me choose what to delay when the deadline moves.

Change a constraint; inspect the consequences.

- **Agentic Software Development**

Draw the thing being changed.

A timeline holds tasks, dependencies and dates.

The person moves one milestone. The interface shows which other dates become impossible.

Change a constraint; inspect the consequences.

- Agentic Software Development

Work the change.

Illustrative plan: research → prototype → user session.

The session moves earlier. Keep it fixed.

Option A: narrow the prototype to the key interaction.

Option B: keep the full prototype and move the session back.

B is unavailable while the earlier date is fixed.

- Agentic Software Development

Make the recommendation visible.

Choose A if the session is meant to investigate that key interaction.

If the full journey is necessary, negotiate the date or change the research question.

Do not silently move a fixed constraint.

- **Agentic Software Development**

Copy this brief.

Decision: ___

Editable object: ___

Person changes: ___

Software recomputes: ___

What survives the session: ___

- Agentic Software Development

Prototype one meaningful change.

Ask someone to use their own unfinished plan.
Notice what they try to change first.
Keep the constraint visible while the person changes the plan.

- **Agentic Software Development**

The completed brief

Decision: what to cut when the session moves earlier.

Object: project timeline.

Person changes: fixed session date.

Software recomputes: feasible scope and sequence.

Saved result: chosen plan, original plan, reason for the change.
