

- Bio-inspired systems

# What should stay steady as the situation changes?

Draw the feedback your product needs.

- Bio-inspired systems

# Name a condition worth sustaining.

For a learning tool: the learner can make progress while encountering worthwhile difficulty.

That sentence is an intention. It still needs an observable interpretation.

Allow time for an effect.

- Bio-inspired systems

# Choose observations that can disagree.

Progress through the task.

The learner's own difficulty report.

Requests for explanation or a new challenge.

No single signal is a complete account of the experience.

- Bio-inspired systems

# Name the available adjustments.

Change the example.

Offer a hint.

Increase or reduce the challenge.

Let the learner keep the current setting.

Allow time for an effect.

- Bio-inspired systems

# Draw the loop.

Desired condition → observation → interpretation → adjustment → changed experience.

Add the delay before an adjustment's effects become visible.

Allow time for an effect.

- Bio-inspired systems

# Work a disagreement between signals.

Illustrative input: the learner completes a task quickly but says the explanation was confusing.

Do not infer “too easy” from completion alone.  
Offer a different explanation, then ask whether to continue or change the challenge.

- Bio-inspired systems

# Keep the person in the diagram.

Who chooses the desired condition?

Who can reject an adjustment?

This worksheet proposes a feedback design; it does not prove stability or educational benefit.
