- Product & autonomy

1. The human decision

Who is choosing what?

2. The useful object

What can they inspect and change?

Example: a learner chooses a project using an editable set of candidate projects.

3. The model's contribution

What can the software propose, explain or generate?

Example: adapt a project to the learner's available time and current interests.

4. What carries forward

What is worth remembering, and can the person revise it?

Example: an unfinished project and the reason it still interests them.

5. Useful alternatives

Which different paths should remain available?

6. Initiative and feedback

When should help appear? What may change?

Example: offer a new direction on return; let the learner keep the original project.

7. The comparison

What would you build to find out whether this helps?

Example: compare revising an existing project with starting again from a fresh recommendation.

Observe the learner's actual choice and the work needed to reach it.

- Product & autonomy

8. The decision after the experiment

For the example: keep revision if it helps the learner reach a suitable next step without recreating their context.

Revise the controls if an important change cannot be expressed.

Drop the revision route if starting fresh consistently fits the task better.
