

- Bio-inspired systems

Sometimes the colony stays home.

For a desert ant, searching for seeds gains food and also costs water. Conditions change the value of the trip.

Harvester ants and the cost of foraging.

- Bio-inspired systems

The same trip. Different conditions.

A dry day changes the cost of leaving the nest. Activity alone cannot describe whether the trip is worthwhile.

Food gained · water spent

- Bio-inspired systems

Restraint can fit the circumstances.

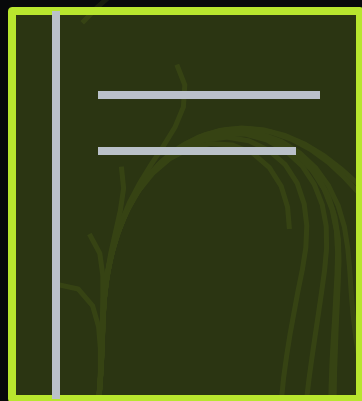

Gordon's field study linked colony responses to dryness with reproductive success. It is an association, not a universal inactivity rule.

- Bio-inspired systems

What would another action make possible?

An imagined research assistant might follow a lead, compare existing evidence or start writing. Each serves a different need.

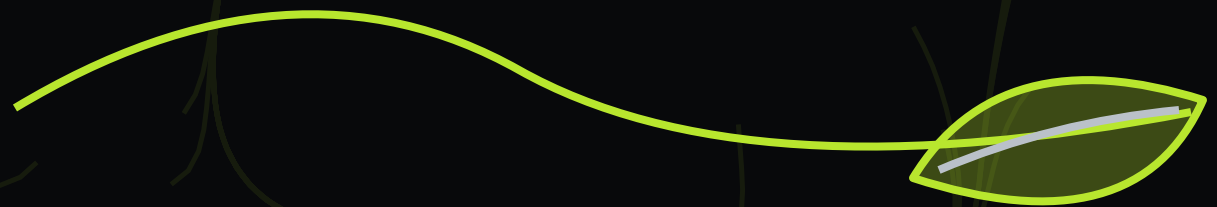

A software proposal, not an ant result.

- Bio-inspired systems

The world is part of the decision.

Bio-inspired design asks how conditions, costs and purposes change the next useful action.

Cost and possibility

More activity is one possibility.
